Continuation of 11. does NOT place the application in condition for allowance because: Referring to Claims 6-7, Hikita et al. disclose an IC card (3) has an ID number ID0, for permitting itself to be identified, stored in memory provided therein. The IC card also has additional ID numbers ID1 to IDn stored in memory areas 17-1 to 17-n that are secured therein so as to be allocated to the individual providers that manage the reader/writers with which the IC card communicates. These additional ID numbers ID1 to IDn are used to prevent unauthorized use of the IC card, and are issued so as to be unique to the IC card by the individual providers that use the memory areas 17-1 to 17-n. Thus, the additional ID numbers ID1 to IDn differ from one IC card to another (column 4 lines 16 to 44; see Figures 1 to 5). Clearly, Hikita et al. disclose a data communication transponder includes ID card memory areas using different formats.

Referring to Claims 1-5, In an analogous art, Williams teaches a certificate form obtains the information necessary for creating a certificate granting authority to utilize an instrument with a report header 2660 entry field that allows a user to enter information for display as a title (i.e. annotation) for the report (i.e. call carrier data set) (column 36 lines 33 to 67; see Figure 26) in order to a customize display to specific transaction records. At the time of the invention, it would have been obvious to a person of ordinary skill in the art to recognize to add annotation to the data set to identify the transaction title in the report taught by Williams et al. in the data communication system that facilitating a transaction using a plurality of data sets on a calling card of Hikita et al. in view of Tamaoki because having a report header entry field to add annotation to the data set as the title for the report would improve functionality to create a customize to specific transaction records.
